Project Proposal

ORM – Online Restaurant Management System

1. Project Overview

The **Online Restaurant Management (ORM) System** is a web-based project designed to provide a simple and user-friendly platform for restaurant customers and administrators. Customers will be able to browse food items, explore categories, place orders, and contact the restaurant. Administrators will be able to manage restaurant information, food categories, products, users, and customer messages through an admin dashboard.

The project will be developed using **HTML5, CSS3, and JavaScript** to create a responsive, interactive, and visually appealing user interface.

2. Project Objectives

- Develop an attractive and responsive restaurant website.
- Display food products with their names, images, prices, and categories.
- Provide an interactive order submission interface.
- Create an admin interface for managing restaurant operations.
- Implement CRUD interfaces for categories, products, users, and contact messages.
- Divide the development tasks among four team members to ensure efficient collaboration.

3. Technologies Used

- **HTML5:** Structure and content of the web pages.
- **CSS3:** Styling, layouts, animations, and responsive design.
- **JavaScript:** Form validation, DOM manipulation, interactive components, and client-side functionality.

Project limitation: This version will be a frontend-only prototype. Without a backend and database, authentication, registration, order processing, and CRUD operations will not be securely shared across devices or users. JavaScript and LocalStorage can simulate these features for demonstration purposes.

4. Project Features and Modules

Module 1: Customer Website — Member 1

A. Home Page

- Restaurant introduction and welcome section.
- Featured food products.
- Food categories and product listings.
- Product images, names, prices, and descriptions.
- Navigation bar and footer.
- Responsive layout for desktop and mobile devices.

B. Order Now

- Display available food items.
- Select products and quantities.
- Add or remove items from the order list.
- Calculate the total price.
- Collect customer information, such as name, phone number, and delivery address.
- Validate and submit the order form.
- Display an order confirmation message for demonstration.

C. Contact Page

- Contact form with name, email, subject, and message.
- Client-side form validation.
- Restaurant contact information and address.
- Success message after form submission.

Module 2: Admin Authentication and Dashboard — Member 2

A. Admin Login

- Login form with email and password fields.
- Required-field validation.
- Simulated login using JavaScript.
- Redirect to the admin dashboard after successful demo login.

B. Admin Registration

- Registration form with name, email, password, and confirm password.
- Input validation.
- Password matching validation.
- Simulated registration for demonstration purposes.

C. Admin Dashboard

- Overview cards for total products, categories, users, and orders.
- Recent orders and recent contact messages.
- Quick-access navigation to management modules.
- Sidebar navigation and logout interface.
- Simple charts or statistics using JavaScript, if needed.

Module 3: Category and Product Management — Member 3

A. Category Management

- Display all categories in a table.
- Add new categories.
- View category details.
- Edit existing categories.
- Delete categories.
- Validate category forms.

B. Product Management

- Display products with images, names, prices, and categories.
- Add new products.
- View product details.
- Edit product information.
- Delete products.
- Assign products to categories.

- Validate product forms and prices.

Module 4: User and Contact Management — Member 4

A. User Management

- Display registered users in a table.
- Add new user records.
- View user details.
- Edit user information.
- Delete user records.
- Search and filter users.

B. Contact Management

- Display submitted contact messages.
- View message details.
- Update message status, such as Pending or Resolved.
- Delete contact messages.
- Search and filter messages.

5. Project Pages

Customer-facing pages

1. Home Page
2. Product Listing / Menu Page
3. Order Now Page
4. Contact Page

Admin pages

1. Admin Login Page
2. Admin Registration Page
3. Dashboard Page
4. Category Management Page
5. Product Management Page
6. User Management Page
7. Contact Management Page

6. Team Responsibilities

Team Member	Assigned Modules
Member 1	Home Page, Product Display, Order Now, Contact Page
Member 2	Admin Login, Admin Registration, Dashboard
Member 3	Category CRUD, Product CRUD
Member 4	User Management CRUD, Contact CRUD

Each member will develop their assigned pages and JavaScript functionality. All modules will be integrated into one consistent website with shared navigation, styling, and design components.

7. Expected Outcomes

At the end of the project, the team expects to deliver a functional frontend prototype of an Online Restaurant Management System. The prototype will demonstrate the customer browsing experience, order form interactions, simulated admin authentication, dashboard statistics, and management interfaces.

The project will also help team members improve their skills in HTML, CSS, JavaScript, responsive web design, form validation, DOM manipulation, and collaborative software development.

8. Conclusion

The ORM project aims to simplify the presentation of restaurant products and demonstrate essential restaurant management interfaces in a single web application. By dividing the work into four modules, the team can develop and integrate the system efficiently while maintaining a consistent user experience.

The current scope is limited to frontend technologies. Backend integration, database connectivity, secure authentication, and real order processing can be considered for future development.
